

Algorithm for Validation of an Email Id.

Step 1: Start the Eclipse Editor.

Step 2: Create a java project and a Class Test to search whether an email is present or not.

Step 3: Create an arraylist to add all the email ids.

Step 4: Using Scanner we can give the email ids at the console and these will be stored in the arraylist.

Step 5: We have to give the number of emails to be entered and the email we are searching for.

Step 6: If the email id we want is present in the arraylist, the message "Found" will be displayed, else, "Invalid email" will be displayed.

Step 7: Exit the editor.
